

# DATA20001 Deep Learning - Exercise 4

Due Friday December 1, before 12:00 PM (noon)

In this fourth computer exercise we are going to work with text and methodologies you can freely choose from [Keras \(https://keras.io/\)](https://keras.io/). Due to absence of our teacher, this exercise has not been formulated as completely as the previous exercises. Because of this and the impending project work, PLEASE REFRAIN FROM SPENDING **TOO MUCH** TIME ON THIS EXERCISE. Once the project is announced, focus more or on that. We will take this into account when scoring this exercise. Use the discussion board on Moodle to discuss issues in the exercise.

## Exercise 4. Classifying text (6pts)

Your task is to solve the classification problem for the dataset we present below. You should solve this exercise in similar fashion as the previous exercise (and you can copy-paste any useful tools from there to use them here, as you see fit):

- Figure out the model which is suitable for the given data, complete from the hidden layers to the representation of X and the suitable loss function.
- Validate and evaluate the model properly.
- Document briefly what you did.

The necessary imports:

In [12]:

```
%matplotlib inline

import keras
from keras.datasets import reuters
import glob
from keras.utils import np_utils
import matplotlib.pyplot as plt
import numpy as np
from keras.utils.data_utils import get_file
from keras.models import Sequential
from keras.layers import Dense, Dropout, Activation
from keras.preprocessing.text import Tokenizer
```

## Dataset

This time our dataset is a dataset of 11,228 newswires from Reuters, labeled over 46 topics. Each wire is encoded as a sequence of word indexes (same conventions).

In [13]:

```
(x_train, y_train), (x_test, y_test) = reuters.load_data(path="reuters.npz",
                                                         num_words=None,
                                                         skip_top=0,
                                                         maxlen=None,
                                                         test_split=0.2,
                                                         seed=113,
                                                         start_char=1,
                                                         oov_char=2,
                                                         index_from=3)
```

Let's see how the data is formatted by printing the dimensionalities of the variables. Refer to the keras-documentation for further info: <https://keras.io/datasets/> (<https://keras.io/datasets/>)

In [14]:

```
print("x_train size", x_train.shape)
print("y_train size", y_train.shape)
print("x_test size", x_test.shape)
print("y_test size", y_test.shape)
print("")
print(x_train[0])
print("Number of classes:", np.unique(y_train).shape[0])
word_index = reuters.get_word_index(path="reuters_word_index.json")
print(word_index)
```

x\_train size (8982,)  
y\_train size (8982,)  
x\_test size (2246,)  
y\_test size (2246,)

[1, 27595, 28842, 8, 43, 10, 447, 5, 25, 207, 270, 5, 3095, 111, 16, 369, 186, 90, 67, 7, 89, 5, 19, 102, 6, 19, 124, 15, 90, 67, 84, 22, 482, 26, 7, 48, 4, 49, 8, 8 64, 39, 209, 154, 6, 151, 6, 83, 11, 15, 22, 155, 11, 15, 7, 48, 9, 4579, 1005, 50 4, 6, 258, 6, 272, 11, 15, 22, 134, 44, 11, 15, 16, 8, 197, 1245, 90, 67, 52, 29, 209, 30, 32, 132, 6, 109, 15, 17, 12]

Here we provide you with a ready embedding. This is a 100-dimensional GloVe -embedding, which works similarly as Word2Vec. You can use either this or the existing features of the dataset. Note that you have to map the above word\_index to the words you can find in the embedding, string by string.

In [15]:

```
database_path = 'embedding/'

dl_file='glove.6B.zip'
dl_url='https://www.cs.helsinki.fi/u/jgpyyko/'
get_file(dl_file, dl_url+dl_file, cache_dir='.', cache_subdir=database_path, extract=True)
```

Out[15]:

```
'./embedding/glove.6B.zip'
```

In [16]:

```
embedding_filename = glob.glob(database_path + '*.txt')[0]
#embedding_data = ""
embeddings_index = {}
print(embedding_filename)
with open(embedding_filename, 'r') as fp:
    for line in fp:
        values = line.split()
        word = values[0]
        coefs = np.asarray(values[1:], dtype='float32')
        embeddings_index[word] = coefs
print('Found %s word vectors.' % len(embeddings_index))
```

```
embedding/glove.6B.100d.txt
Found 400000 word vectors.
```

In [17]:

```
embedding_matrix = np.zeros((len(word_index) + 3, 100))
for word, i in word_index.items():
    embedding_vector = embeddings_index.get(word)
    if embedding_vector is not None:
        # words not found in embedding index will be all-zeros.
        embedding_matrix[i] = embedding_vector

print(embedding_matrix.shape)
#print(embedding_matrix[2])
```

```
(30982, 100)
```

## Discussion

For all models, I use pretrained GloVe embeddings and I initialize the embedding matrix by 100 0s in a row if a word in the word list in dataset does not appear in GloVe embeddings otherwise embedding vectors are kept in the embedding matrix. In other words, this is how I map GloVe embeddings to word list of the dataset. For all five models that I have built, the stucture of the network is like: Input layer -> Embedding layer -> Conv1d layer 1 -> maxpooling -> Conv1d layer 2(with relu) -> maxpooling -> Conv1d layer 3(with relu) -> maxpooling -> whether or not contain drop out layer -> dense(with relu) -> dense(total number of classes, with softmax) -> Output layer. For each model, I only change one or few value of parameters. The following table shows what parameters are changed for a model and accuracy on test data for each model. In addition, the loss function utilised is cross entropy.

	Whether Trainable for Embeddings	Epoch	Optimizer	Drop out layer	Maximum input sequence length	Accuracy on Test data
<b>#1 model</b>	No	50	Adam	No drop out layer	1000	65.14%
<b>#2 model</b>	No	50	Adam	No drop out layer	2376	62.11%
<b>#3 model</b>	No	30	Adam	0.2	1000	65.36%
<b>#4 model</b>	<b>Yes</b>	<b>30</b>	<b>Adam</b>	<b>0.4</b>	<b>1000</b>	<b>72.4%</b>
<b>#5 model</b>	Yes	30	rmsprop	0.4	1000	64.96%

As shown in the table, the best model is the 4th model and accuracy is 72.4% and it improves 10.29% compared to the second model with accuracy 62.11%. If we only compare 1st model and 3rd model, accuracy also improves 0.22% although epoch is only 30 for 3rd model. Thus we can conclude that drop out layer is helpful for improving performance of models indeed. In addition, if we compare 2nd model with 1st model, the accuracy decreases 3.03% because maximum input sequence length changes to be 2376 and increasing the maximum input sequence length also requires more runnning time. Thus for the rest three models I set the maximum input sequence length to be 1000. However, if we compare 5th model with 4th model, the accuracy decreases 7.44% because optimizer of 5th model is changed to be rmsprop. Thus we can conclude that Adam is a good optimizer in this case.
